

HandSan Hand Sanitiser Solutions

The HandSan range of topical antiseptic hand sanitiser solutions, from Reagecon, are developed and formulated in line with FDA/USP/WHO guidelines. Reagecon has been producing these products for over 20 years, but their application for topical use is now possible, due to the lifting of regulatory restrictions

All regulatory and public health bodies, emphasise that washing of hands with soap and water, in a frequent, thorough and prolonged way (at least 20 seconds) is the optimum way to prevent the spread of the COVID 19 virus. If soap and water is not available, the use of the Reagecon HandSan alcohol-based solution is the next best line of defence. This product inactivates viruses, that are genetically related to and that have similar characteristics to the COVID 19 virus.

The hand sanitiser is compounded using high-quality ingredients in the preparation of the final product, consistent with World Health Organisation (WHO) recommendations:

- Ethanol 75%/80%, volume/volume (v/v) in an aqueous solution
- Glycerol (1.45% v/v)
- Hydrogen Peroxide (0.125% v/v)
- Purified Water
- Available as Liquid or Gel (Gelling polymer added only to the gel solutions)
